MONTHLY MILESTONE

June 2023 Issue

Dear Monthly Milestoner,

Tech obsession hits an all-time high.

From AI to semiconductors and ChatGPT, people just can't get enough of tech's ever-evolving landscape.

The problem is that so many people adore tech, but they don't all rack in to-die-for profits.

In today's issue, Benzinga analyst Gianni Di Poce reveals the real reason investors aren't scoring double- and triple-digit gains in the tech market…

And how he located one tech stock that popped 46% in just four days. It gets better…

There's plenty more from where that came.

But you'll have to read the issue to get the inside scoop from Gianni.

Cheers to profits,

Nikia Wade

Host, Monthly Milestone

"TECH MONEY MASTERY: HOW ONE ANALYST EARNED 46% IN JUST 4 DAYS!"

Monthly Milestone Interview with Gianni Di Poce

Nikia Wade: Hello all, and welcome to the very first episode of the Monthly Milestone podcast. I am your host Nikia Wade. And, with me, I have our very own Gianni Di Poce. He has over a decade of market analysis and trading experience.

He demonstrates a history of applying technical, cyclical, and economic analysis to provide investors and traders an additional edge in the market. So I definitely wanted to give you a shoutout, Gianni. Thank you so much for making time for the first episode.

Gianni Di Poce: I'm really glad to be here, Nikia. Thank you for having me.

Nikia Wade: For our listeners, here's what you can expect from Monthly Milestone. You'll get boots-on-the-ground insight from Benzinga Research's analysts. They'll reveal what's hot in the market, what you need to keep your finger on the pulse, and (even more important) where the opportunities are. You need to know where the money is hiding. If you want to know, you want to talk to the best in the business. So that's why we have Gianni here today.

Why Some People Love Tech But Don't Score Big Profits

Nikia Wade: Gianni, tech is all the rage. From Bitcoin to non-fungible tokens (NFTs) and artificial intelligence (AI), tech is by far one of the most fascinating industries right now. Could it be that tech evolves at such a quick pace? Why do you think tech is so hot right now for investors?

Gianni Di Poce: Well, that's a really good question. You know, we had a pretty rough 18 to 24 months in the tech space. There were a lot of supply chain disruptions that began with the fallout of the COVID lockdowns and all that stuff. We went from a shortage of chips and tech components to an oversupply. So there were a lot of supply side issues that had to be resolved within tech.

Then you had that big wave of inflation. Coupled with the supply chain issues, that created a tough time for the consumer. So you didn't see as much discretionary spending for that little window. Since June 2022, Nikia, inflation has come down quite a bit. Now, it's still hanging around, but it's been about a year now.

So I think the consumer has been able to recuperate, and we're seeing a little bit more discretionary spending. A lot of that money out of consumers' pockets is flowing back into tech. And not just that. To the point you just raised, there's a lot of innovation. And with that comes the potential for an increase in profit and earnings. And that's what really attracts money in the financial markets.

Nikia Wade: That makes total sense. Right now, you can't go on any financial news site or look at any major headlines without there being some kind of mention of AI. It is everywhere, whether it's the surge in ChatGPT usage or updates on social media.

The thing is, everyone isn't actually making the profits they want when they do invest. There's obviously a huge interest, but not everyone is getting those double-digit or three-digit gains.

So where do you think that many investors are falling short, and what are some of the challenges with investing in even today's tech market, especially with AI and semiconductors? Where are investors going wrong?

Gianni Di Poce: I think a big part of it is access to the right information. There is no shortage of information on the internet, but I think it comes down to the quality of that information. Now, when it comes to tech, it's a leading sector in the market. So we tend to see it top out before the rest of the market. We also tend to see a bottom up before the rest of the market.

Coming into this year, there were a lot of people who were really scared and concerned for the direction of the economy. But, we have the receipts Nikia. We can go back and look at those Benzinga Insider Pro reports in December and January. And we were not very bearish coming into this year. We thought it was a good buying opportunity, and we were looking at a lot of these tech names in the first quarter and really doubled down on it in the second quarter because we knew they were on sale.

Let's just face it: Tech is by far, in a way, the most important sector in the overall market. So if tech does well, a rising tide does really lift all the ships, and it's going to help the overall market. And hopefully we do see some follow-through here. But I'm really encouraged by the strength that we're seeing from the tech sector and that it could turn into other sectors of the market as well.

The Tech Stock That Soared 46% in Mere Days

Nikia Wade: Yes, I love it. I'm sure that's really good news for the listeners. Everyone, at the end of the day, you get in the market because you want to make money. So speaking of making money... You've had some success with investing in the tech industry. I know there was a very recent win that you had with one tech company. We won't give the name up quite yet, but tell us about that. What drew you to the company? How did you identify the opportunity? Give us the details!

Gianni Di Poce: Well, it's a semiconductor stock. And it kind of ties into that whole chip story with respect to the supply side that I shared a little bit ago. Here's what I like to do. Whenever I see an emerging theme coming from the stock market, I like to look at related and associated industries. I focus on something that's upstream on the supply chain, I consider things that are going to benefit on the secondary or tertiary effects with respect to emerging economic trends.

The stock that I was looking at had some pretty good technical pictures. I'm a big technical guy. I do like chart patterns, and I was checking off all my boxes in that regard. During my research, I saw some pretty good evidence of accumulation. And there are ways that you can look for those signals to see if there's money flowing into a stock and if that's translating to strength in that stock just yet.

This one came up on my radar because it was exhibiting some relative strength, meaning that it was outperforming the Index. And when that happens, it's usually a sign that if the overall market starts to rally, then a particular stock will outperform to the upside. So that's always something I'll look for as well. With this technical pattern that I saw in this stock, it was indicative of a reversal in trend.

I recall a few minutes ago when I said, you know, tech went through a transitional period between 2021 and 2022 where it underperformed after years of outperforming. But it's looking like, in hindsight, that was really a good time to start accumulating.

So I thought the stock was on sale. It had really strong cash flow. We actually saw cash flow. Its free cash flow increased almost 70% compared to the previous year. And this stock is also heavily involved in the AI space, creating a lot of those chips and components for all the computers and programs that need to exist to create the neural network for artificial intelligence.

Not only that, but the stock is heavily involved and invested in the 5G infrastructure development. So I think there's a lot of demand for this company's services.

And when I saw that it was significantly off its all-time high from a couple of years back, I thought it was on sale. So I shared it with our readers, and we had a really nice pop in a short period of time.

Nikia Wade: So for those who are listening, I was crunching the numbers. So for this particular stock, the entry price was $45. You recommended it on May 22nd. Four days later, it popped from $45 to $65.65. So we're talking about a 46% increase in just days. So if I would have gotten in on your recommendation… If I bought 112 shares at $45 a piece, I would have walked away with an additional $2,300 in just a few days. Is that right?

Gianni Di Poce: Yes! That does seem correct, Nikia.

Nikia Wade: I told you that I was crunching. That's really incredible. What are your thoughts on that? Have you gotten any other feedback after that that pop in price for that stock recommendation?

Gianni Di Poce: I had an upside target of around $60 initially. So we put out the alert, like you said, on May 22nd. Then, that day the stock opened at $45.04 and we had a sell target of $60. Its earnings report was a couple of days later. It gapped up significantly after hours, and it opened almost 20% higher the day after its earnings report. And that would have been on May 26th. And then in a matter of two days, the stock ran up over 40%, like you said.

So they [the Company] had good guidance. They kind of talked through the headwinds that the industry has been working with. And they said, "Hey, we might have some certainty when it comes to sales and other revenues in the near future. But ultimately, we think this high demand that we're seeing from a plethora of industries is going to power us through that." And that was enough for the market to bid it up 40% or so in just a couple days.

Obviously, our earnings reports don't always end up that way. But, as I like to say, the trend is your friend. And we saw signs that the trend was changing.

Sometimes, you get those big moves in a short period of time. And it's really nice when that happens. It allows you to walk away with that nice profit in a short period of time.

The Big Reveal

Nikia Wade: I think that I was even being a little on the conservative side, right? I thought if I dropped $5,000 upfront ($45 a piece for 112 shares), I'd have a nice return. But if someone had a little bit more pocket change, (s)he could have gotten up to five grand in gains…

There's so much that somebody could do with that. That could be your next vacation with your family or you could go ahead and reinvest in the next recommendation that you send out.

So I think that really just reaffirms that comment that you made earlier; there's obviously a demand. People want to invest in tech, but not everybody's getting the results that they want. And it's because there's so much information on the internet, but it's not necessarily the right information

Gianni, you've managed to find a way to locate so many different stocks. You're giving out quite a few different stock recommendations on a weekly basis. And it's common that we're seeing strong two-digit returns.

So that's what the people are looking for. So I guess we can go ahead, right? I feel like we've shared enough, so we can go ahead and reveal! So what was this company that you recommended? What's its name? What's its ticker symbol? We can let the readers know all about this recent success story…

Gianni Di Poce: Okay, if you say so! It was Marvell Technology Inc. The ticker symbol is NASDAQ: MRVL. This stock is traded on the NAAnd the good news is that this recent move that we saw… In technical speak, we call it a bullish breakaway gap that we broke out from. The pattern that I was referencing was called an inverted-head-and-shoulders pattern. And we broke the neckline; we had a bullish breakaway gap.

So I think that this is a really strong signal, Nikia. The correction that the stock experienced between this all-time high in December 2021 and its correction low in January 2023 is a really strong sign that that corrective bear trend is over and that we're in a new bull market in the stock.

So even though we captured our gains on that initial trade, I do think this stock still has the legs to the upside, and it's going to stay on my radar for quite some time here, probably at least for the next several months.

Another Hot Tech Stock With Room For Growth…

Nikia Wade: I love that. And that is good news for investors. Now, I do want to pivot just a little bit. So like I said, guys, this recommendation had popped up over 40% in just a matter of days. Imagine how much money you could pocket from that. But this is not a one-and-done deal.

I mean, this is very common for you, Gianni. So there is actually another recommendation on your radar. So go ahead and tell us about that, what you love about it, and what the financials look like. What has that stock been doing lately?

Gianni Di Poce: Well, this is another stock that is involved in the AI space, but it's an Internet of Things (IoT) stock. So it works more in the cloud infrastructure space. It has some data storage solutions, but it's kind of similar to the Marvell stock.

I do like the technical patterns that it was exhibiting. And, in fact, I would argue the technical patterns were probably even stronger ,with respect to the more recent timeframe, compared to Marvell.

So this is one that we've been having on our radar for quite some time. And it's really unique in the sense that it uses artificial intelligence in fleet management. So what that means is that we have a lot of trucks and fleets in the country that are so integral to the supply chain. And obviously we're coming out of a time where the supply chain displayed its fragility.

So this is how markets work, Nikia: When a weakness is identified, capital gets reallocated, reinvested, and shuffled around markets to make sure that those types of issues don't happen again within reason. And so I think this company is really in a strong position to capitalize on the supply chain weaknesses that were exposed over the last couple of years while integrating a new and booming sector of the economy that is artificial intelligence.

The company hasn't been around that long. It's only been around for a couple of years. So it is very much in its infancy. But, already, it's only been publicly traded for not even two years or around two years. And it's already racked up about $795 million in annual recurring revenue just from those clients that it has in that fleet business.

So I really like what's going on in the stock right now. And one of the trends that the company is exhibiting is that a lot of its customers are trending more toward the higher end of the business. Now, granted, with artificial intelligence, it's a lot easier to scale because you don't have to dedicate as much time and labor to the organization of the supply lines. But the fact that we're seeing a trend toward the higher segments of the market, it's almost like I'm going to call it a luxury-end artificial intelligence supply chain stock, if you will.

So that's kind of what I'm gathering from my research on this stock so far. I have a couple more points I can talk about on this stock if you like.

Nikia Wade: Yes, go to town! I think that the more the investors know about the stock and why you feel so confident about it, the more insight they'll have as to why it is such a great move to make.

Gianni Di Poce: When it comes to this stock, it's using artificial intelligence to make its routes and its fleet organization all that much more productive. So when your customers are these trucking companies and these distribution companies, they have some really important expenses and costs that really take a lot out of their bottom line.

So this company has already processed over 6 trillion data points. And this artificial intelligence will actually go into this data and detect various points where the companies are exposed with respect to safety events.

If you're a fleet and you have the check engine light on,for example, it's able to identify what the problem might be a lot faster versus taking it to the shop and having the mechanic look at it.

This helps reduce insurance premiums. It helps manage fuel costs more effectively. Ultimately, what that does is extends the asset life for these companies. Now, it was easy in a low-interest-rate environment (as we're coming out of right now). From 2010 to 2022, interest rates were pretty much at zero. It was at the beginning of 2022 that we started to raise rates. So it wasn't as big of a deal for a company when it came to the interest expense.

Now that inflation has remained stubbornly high, fuel costs are eating out of the company's bottom line. And that really is not something that the shareholders want to see. So by adopting this type of tech, I think it really helps to save time and money. It can help grow their bottom line. There's only going to be more money flowing into this space, in time, especially when it comes to labor shortages. It's not easy to find people of skilled trades nowadays to do that type of work. So if you can identify those problems faster, I think it makes the solution a lot faster too.

Show Me the Money: Future Dividends Potential + Growth

Nikia Wade: I think that you hit that on the nail. One thing I know is that investors listening want to know this. Now, you did mention that this is an early-stage company. So are there opportunities for dividends at the moment with this company? Let's address that.

Gianni Di Poce: It follows a pretty similar framework that other early-stage companies follow. There's no dividends or opportunities for income generation at this point. However, once upon a time, Apple didn't pay a dividend. Once upon a time, a lot of those big tech companies did not pay dividends. So this is a candidate for that type of growth in the long run. So I think, down the line, that could be a potential way to generate income.

Where I come from isn't really in the camp of buying stocks with the intensive capital appreciation. Dividends are kind of like a bonus. I'm not going to buy a growth stock for its dividend. I'm buying a growth stock for its growth potential. You have to know what you own, what you're buying, and why you're buying it. It's not just like throwing money at the wall.

This isn't the bull market of the second half of 2020 or the first quarter of 2021. You have to do your due diligence now. And that's just where we are. So it's about knowing what type of market we're in and knowing where we are in the economic cycle.

And I think that there's reason to believe, given the leadership that we've seen from some of these stocks, that we are in the early phase of another run higher. Now, that doesn't mean there won't be volatility or bumps on the ride. However, the outlook here is, given the leadership from tech and these these just names, that's not the type of leadership you see in the late stage of a bull market. That's the type of leadership you see in the early stages of one.

Ticker Symbol Reveal + The Powerful, Almighty Customer

Nikia Wade: Awesome, let's go ahead. We teased this long enough. I'm sure that listeners are sitting on the edge of their seats and just want to know, for goodness sake, what is the name of the company? What is the ticker symbol? Let's go ahead and drop it on them.

Gianni Di Poce: So this is Samsara. The stock ticker symbol is NYSE:IOT.

And I did neglect to share probably one of my favorite projects that the company is working on. They were just awarded a new patent for dashcam technology that actually helps monitor safety events in real time.

That is a really tremendous avenue for future growth because who are going to be the customers in that case? Governments. Governments can print as much money as they want, whether it's police departments, state police organizations or National Guard agencies.

This is one of the biggest developments that they've had recently was the granting of this new patent. I think it's going to really, really take off. And if the government is your customer, you're going to get paid.

Nikia Wade: That's the truth. If you're looking for a customer to pay, the government is definitely the customer that you want to have. And also, so what was the entry price on this recommendation? What ballpark is the stock in now? And do you foresee that there should still be more upside on this play?

Gianni Di Poce: So I shared Samsara in the weekly Benzinga Pro Insider Report this past weekend. It would have been published on Sunday, June 4th. At the time, Samsara had just broken out from a triangle formation. These are known to be continuation patterns, and the stock was already in an uptrend

So when I identify a continuation pattern, I see the stock starting to break off from it. Well, two plus two equals four. I'm looking for a resolution higher and a continuation of the bull trend. So it closed out today at around $28 per share. When I shared that stock, it had closed the previous Friday on June 2nd at $24.31 a share. It's already up almost just over 15% on the week. But my upside target was in the $30 to $32 range. We're not too far away from that.

This was really just for a short swing trade. So I was looking for a 20% to 25% return on the swing. As I look ahead at the potential for the stock; I think it can go much higher, especially if it starts taking out its highs from December 2021.

If we see IOT starting to clear that $30 to $32 level of resistance, I think we need to back up the truck on this stock. It could be a major player in this AI thing that we've been seeing in the markets lately.

Nikia Wade: I'm sure that makes our listening investors tickled pink that you just dropped that ticker symbol for them and that you still believe that there is a lot more room for that stock to go up.

So we have Samsara, as you mentioned it, which is still an active play right now in your portfolio. And then we have your success story with Marvell Technology Inc. And there are still so many other companies that are on your radar now. We're not going to give everything away.

The Future of Tech Investing: The Next Big Merger

Nikia Wade: You've kind of touched on this already, but I would love for you to go a little bit deeper. What is the future of tech investing? Where is it headed? What are the macroeconomic trends that investors should really be looking out for now and even maybe some macroeconomic trends that they can expect you to cover in your paid subscription?

Gianni Di Poce: I think it's just adoption. The last big technological innovation was obviously the internet. We had the dot-com bubble in the '90s. The dot-com bubble peaked in 2008.

We saw the Nasdaq crash for a couple of years, and it took until 2015 for the Nasdaq to make a new all-time high. So it took almost 15 years (between 2000 and 2015) for the Nasdaq to make a new high from its previous all-time high.

But what did we see during that period between 2000 and 2015, Nikia? We saw the wide-scale adoption of the internet into our daily lives, whether it was what students were learning at school or upgrading our Internet from dial up to high speed internet. Or maybe it was 3G, 4G, 5G. Well, 5G is more recent, but I think you get the idea.

We saw the massive implementation and adoption of the internet into our daily lives. That's the big theme to be on the lookout for when it comes to artificial intelligence: This adoption is not going to happen overnight per se. We live in a society where people are either very inclined to adopt tech right away or there are people who arrive late to the party, so to speak. They're not in a rush. And that's okay because that's all part of the economic cycle. So I think that's what we have to be on the lookout for when it comes to tech.

The elephant in the room is crypto and the adoption of cryptocurrencies into the everyday economy. Let's face it. I think the next big merger between tech and money is between artificial intelligence and crypto. I know there are some projects out there that are kind of dabbling in that space, but there really hasn't been anything concrete yet, to my knowledge, that fuses artificial intelligence and crypto.

There are algorithms and cookies on the internet that gear the advertising towards what you click on online. But there are some privacy issues with that too. So I think that's getting resolved, and it's moving from a cookie-based internet to a token-based internet. And I mean token like in the crypto vocabulary, because all the data is going to be tokenized.

I think the companies that are going to do well (obviously in tech) are the ones that offer those services. The other companies that use their customer data wisely and are able to implement these technologies, they're going to be able to know, to a degree, what their customers are going to want to buy next. At the same time, they'll also respect their privacy through the tokenization of the data.

So I think that's a big theme. It's almost absolutely necessary that this happens. You asked about macroeconomics. In the world that we're in now, things have changed. That's not very profound on its face. We were in a crash in 1981 to 2020. We were in a secular bear market. That means interest rates generally fell from that 1981 high to that all-time low in March of 2020, which coincided with the COVID crash in markets.

Consumer psychology dramatically shifted during that time. People, before that, took price stability for granted. They also took the fly-by-night supply chain system that we had for granted. But what the lockdowns and COVID did is they exposed the fragility of that.

We saw a shift in psychology. People started purchasing goods and services in anticipation of higher prices in the future because they were like, “Well, if I don't buy now, then it's going to cost more later.” That is a massive shift in psychology that really wasn't the case.

For a decade or two, people were just like, “I'll just save now because I'll be able to pay it with cash down the line.” But we've seen a big rise in debt. And as a result, the cost to service increased as well.

For these companies, if you're not implementing this tech to save on your overhead, you're going to have a tough time. It's not only that, Nikia, but we have the risk-free rate in the market right now. T-bills are paying 5%. So unless the company is offering value or organic earnings growth above 5% a year, there's really no reason for market participants to give them their money.

The Opportunity of a Lifetime That's Less Than a Big Mac

Nikia Wade: Thank you for giving that very in-depth forecast of what we can expect as far as macroeconomic trends. And, honestly, that's where you come in, right? This all ties back in that there's so much information to digest. So many things are shifting, but it's so important to be tied in with the right information with someone who is getting results. And that's you.

And of course, you do want to make this disclaimer, guys: Nothing that is shared in this podcast should be interpreted as personalized investment advice. That's not what we're doing here. But what we are offering you is the opportunity to learn about these rare opportunities that could have huge potential to bring you two-digit returns in a matter of a few days.

We went over it today with the previous Marvell Technology Inc. And, again, it's not a one-off thing with Gianni.

So, Gianni, let us know. If someone listening now says, "I want to take a chance and subscribe with Gianni. He knows what he's talking about. He knows the market. He's getting the results," how can they get access to you on an ongoing basis?

Gianni Di Poce: We have a couple of services here at Benzinga that are really great. So we have the Breakout product series, the starter level. You get two stock picks a month. Those are swing trades.

So we give you really what would be my three main filters. We also call them the "Delta Factor," if you will. These are three filtering mechanisms that I use. We're teaching you how to do this yourself. It's not just like a "Oh, hey. Here. Buy the stock, and then see you next month" type of thing. No, we want you to know why we're getting into any particular position.

So we'll share those three factors with you. Then, we'll give you the entry point. We'll give you an exit price.

So we'll share those three factors with you. Then, we'll give you the entry point. We'll give you an exit price. If the trade works in our favor, we give you a stop loss because I'm so big on risk management. That's really the only way you last in this business.

I've been blessed and privileged to be in this business now for over 12 years. And the only reason I've survived this long, Nikia, is because I practice risk management. So if you are not knowing how and when to cut your stop losses, this service will teach you how to do that.

And sometimes you get into a trade and it's working in your favor, but it's not in your expectations. We also do have a point in time where we say, "It's time to abandon this trade with respect to this swing trading strategy." The whole point of a swing trade is to hold it for at least a couple weeks or a couple months.

Once you get into a couple months' threshold, you get into position trading. And once you get past six or seven months, this turns more into a buy-and-hold type of thing. So it's a swing trading service. It's quick in and quick out. We either hit our lick or we're out and on to the next one. So that's how the Breakout: Starter service works.

We're talking about macro here. If you want to learn the macro and know how this all ties in together: Capital is like matter from science class. It's never created or destroyed. It simply transfers from one sector country or asset class to another.

So think about this: If the stock market crashes, really what just happened is your cash appreciates tremendously in value. So that's how I'm constantly reinforcing that type of thinking.

It's not a doom and gloom publication. It's not a permeable publication. The law of nature is cycles, and the market is really just downstream from nature, in the sense that all of these individual market participants are coming together in this marketplace, acting off of the best information they think that they have, and making a decision whether to buy and sell what we are doing.

With this Benzinga Pro Insider Report, what we've been doing for quite some time, is cutting through all the noise. What do you actually need to know? What do the central bankers actually look at? I did my undergrad studies in economics once upon a time. So I do know what the central bankers are looking at and what type of theories they use.

That's important now because the central bankers and the monetary policymakers are not portfolio managers. They are not traders. But it helps to know how they think, what they think, and why they are doing what they're doing.

Basically, we're putting ourselves into their shoes, and that gives you an extra edge in markets as well. At the end of the day, we all have to deal with the Fed and the other central banks around the world. So we're cutting through all that noise. We're not doing doom and gloom, not permeable.

Like I said, the markets are cyclical, and they're very orderly. That's the thing. It's not as chaotic as some out there may want you to believe.

There is a buyer for every seller. And when there's not, that's when you get the crashes. And there are signs that you can look for leading into those types of environments where you can deduce, "There's no liquidity right now, so what are we going to do?"

Well, we talk about that in the Benzinga Pro Insider Report quite a bit at length. And if you want the more macro background, current events of the week, that's a good report as well.

Nikia Wade: I will definitely include a link in the written transcript of this opportunity. If you're listening and this is something you really want to get into, great.

We're going to make it very easy for you. I'll make sure to drop a link in the transcript where you can go and easily sign up.

Now, usually for a service like this, where you're getting two free stock picks every month through Breakout:Starter, that would run somebody $15 or $30. Some people will pay even as much as $50 a month to get that type of insight from someone who's been boots on the ground for the past 12 years. But the really cool thing is that Gianni has been so generous. At the end of the day, he is here to help the everyday investor. So to get started, it's only $7 a month, which is honestly, nowadays, less than a meal from McDonald's or Starbucks.

So the next time you're thinking of getting that Big Mac deal, consider something...

What's that going to add to your life opposed to really investing in your future and working towards that financial freedom? I mean, it almost seems like a no-brainer to me.

And like we were discussing before, you have your Benzinga Pro insider Report, right? And that just really even sweetens the deal.

For anyone who subscribes to Gianni's Breakout: Starter, we're throwing in the Benzinga Pro Insider Report for free.

So with that, you get three additional stocks every week. So you're getting three new stocks every single week with Benzinga Pro Insider Report, and that's on top of the two stock picks that you're getting every month from Breakout: Starter.

So what is it, 14 stocks a month?

Gianni Di Poce: Yes, 14 stocks.

Nikia Wade: You get 14 stocks a month for only $7 a month. So I just feel like there's no comparison. I will be sure to go ahead and pop in the link if you guys want to get started immediately. I know Gianni will be happy to have you guys on board.

I'm super excited over what we covered today. You dropped some serious gems. I love that you gave the example with Marvell Technology Inc. And, really, the proof is in the pudding.

There are so many people right now trying to give recommendations. And it's almost like they're just throwing a dart in the dark.

But there's actually proof that what you're doing, your method, and your insight is working. So it only behooves people to jump on the bandwagon. Was there anything else that you wanted to share with our listeners today before we wrap?

Gianni Di Poce: In the Benzinga Pro Insider Report, the way we explain the stocks are a little bit different compared to the Breakouts. I just want listeners to be aware. The Breakout is more technical oriented, and there's more specific actions to take.

But in the Insider Report, it's more fundamental. We do touch on the technicals a little bit, but there's more of a story behind the stock. And the instructions are more like a buy, sell, hold type of rating. We do share upside targets.

For example, if the stock were to fall below this mark, you would know I'm not so interested in it anymore. I just wanted to share that so listeners can know what to expect. There are a little bit of discrepancies between the action items and these two respective products.

Nikia Wade: Love it. And I think that is the perfect insight. If you're someone who has been investing for a while, but you're looking for a little better quality, or if you're someone who is just getting started and really just trying to understand what is this investing about... And you really don't want to feel like you're gambling and just throw your money anywhere only to be disappointed... So Gianni is definitely your guy.

Like I said, I will go ahead and put the link in the transcript so that you guys can get signed up ASAP. We're not charging you $50. We're not charging you $15. Look, you can get started for $7 a month and get 14 new stock recommendations.

Where else can you find that? So I'm super excited for what the future holds for those who are closely connected with Gianni.

And I would strongly encourage you guys to jump on this before the price goes up.

Gianni, again, thank you so much for getting us started off right with episode one of Monthly Milestone. I definitely look forward to when we get to speak again and learn about all of your progress and really what the listeners should be paying attention to as far as the market.

Gianni Di Poce: Thank you so much, Nikia, and thank you for having me on. It was really a lovely discussion that we had today.

Nikia Wade: Thank you so much. Take care.

Editor's Note: To access Gianni's Breakout: Starter (and free access to his Benzinga Pro Insider Report) for only $7 go here right now. That's 14 new stock recommendations each month for only $7 to start. Secure this insanely low rate today.
